Abstract:

Source: DE19715464A1 The system has at least one housing (10) which contains a folded, expansible cushion (2) for preventing a criminal's action, coupled with at least one device for filling it with a gaseous, liquid, or solid medium (1). In the filled, unfolded state the cushion extend in the criminal's direction and impacts against him. Preferably, the housing with the inactivated cushion is integrated with a wall, ceiling, floor, a partition, or in a piece of furniture and is located between the threatened person (4) and the opposite criminal (3), or at the latter side, above, or under the same. The cushion is filled under control of a device which activates an ignition or valve mechanism control unit. The control device is operated by a wire or wirelessly, and receives a signal from an optical, magnetic, acoustic, heat sensitive sensor or mechanical intruder sensor, and also has a connection with a manual input unit, e.g. keyboard, rocker- or single throw switch or control panel.
